

PLENUM BOX SIZING FOR AIR HANDLING UNIT (AHU)

Plenum box sizing for air handling unit (AHU):

$$Q = V \times A \text{ ----- (1)}$$

- Q = flow rate (Cubic feet per minute) >> CFM
- V = Velocity (feet per minute) >> ft/min
- A = Area of plenum box (Square feet) >> ft²

Velocity for Air handling unit (AHU) is **800 ft/min**

Let's say according to our calculated heat load tonnage is = 8 TR

As rule of thumb 1TR needs 400 CFM

So, 8 TR needs = 8 x 400 = 3200 CFM

As per equation 1:

- $A = Q/V$
- $A = 3200/800$
- $A = 4 \text{ ft}^2$

$$\text{Area of Plenum box} = W \times H \text{ ----- (2)}$$

According to site condition we have to assume height of plenum box and try to find width

$$\text{Assume } H = 1.6 \text{ ft}$$

So, using values in equation 2:

Width of plenum box

$$W = \text{Area of plenum box} / \text{height of plenum box} = A/H$$

$$W = 4/1.6$$

PLENUM BOX SIZING FOR AIR HANDLING UNIT (AHU)

Width of plenum box = 2.5 ft

Depth of plenum can be calculated by using following equation:

$$D = 2.5 \times d \text{ ----- (3)}$$

Where d = diameter of fan blower of AHU

$$\text{Assume } d = 12''$$

Using equation 3:

$$D = 2.5 \times 12$$

$$D = 30'' = 2.5 \text{ ft}$$
